

Fistball Arena

& Fistball Live — open-source tournament platform for fistball

Fistball Arena is a free, open-source platform for running fistball (punhobol) tournaments end to end — from building the schedule and knockout bracket to scoring matches on a digital game report and publishing live results. Its companion, **Fistball Live**, is a public spectator app that shows scores, standings, bracket and schedule to anyone, with no login.

This document describes the apps, the license, and how to contribute.

What the apps do

Fistball Arena (organizers, sign-in required)

- Run **multiple events**, each with per-event roles — **admin**, **official** and **viewer** — plus global **org-admins**, all managed from a single Users & access grid.
- Generate the **schedule** (groups, round-robin, knockout and placement matches) with a drag-and-drop arranger, court/day windows and per-phase best-of.
- Score matches on a **digital game report** with live scoring, locks, cards and PDF export.
- See **standings** and an **auto-advancing bracket**; publish to Fistball Live.
- Import rosters and past events from Excel/Google Sheets; add custom event branding.

Fistball Live (public, no login)

- Live scores, standings, knockout bracket, full schedule and a cards list.
- Event countdown and a **weather forecast** for the event location.
- Installable PWA that works offline and updates automatically.

How it works

Both apps share one **Firebase** project (Google Auth + Cloud Firestore). There is no server to run.

- **Arena writes** everything under `events/{eventId}/...` (games, reports, results, rosters, members).
- A few **public** documents are readable without login — which event is on air, the event info/logos, and the results — so **Fistball Live** can show everything with no authentication.
- Access is enforced entirely by **Firestore security rules**; the client config is public and not secret.

Tech: Arena is React + Vite (PWA); Fistball Live is plain HTML/CSS/JS. Both deploy as static files (e.g. GitHub Pages) with continuous deployment via GitHub Actions.

Run your own instance

You need a Firebase project with Google Authentication and Cloud Firestore enabled.

1. Copy `.env.example` to `.env` and fill in your Firebase web config and bootstrap admin email(s).
2. Publish `firestore.rules` (edit the bootstrap admin list) and create the `members.email` collection-group index.
3. Build and deploy:

```
npm install
npm run dev    # local dev
npm run build  # production build → dist/
```

Full step-by-step instructions are in each repository's README.

License

The source code is released under the **MIT License** — one of the most permissive open-source licenses. In short, anyone may:

- **Use** the software for any purpose, including commercially.
- **Modify** it and create derivative works.
- **Distribute** and **sublicense** copies, and even host it as a service.

The only condition is that the original copyright notice and license text are included in copies. The software is provided “as is”, without warranty.

Trademarks & logos are NOT covered by the license. The apps ship neutral placeholder marks; federation/club logos (e.g. IFA, PAFA) belong to their owners and must be replaced in a fork.

How to contribute

Contributions of all kinds are welcome — code, bug reports, documentation, translations and ideas.

- **Report a bug** or **suggest a feature** by opening an issue (templates are provided in the repository).
- **Improve docs or translations** — the interface is English and localization help is very welcome.
- **Send a pull request:** keep it focused, match the code style, and make sure `npm run lint` and `npm run build` pass (CI checks both automatically).
- Never commit secrets, your `.env`, or third-party logos/trademarks.
- By contributing you agree your work is licensed under the MIT License.

Please report security issues (e.g. a rules gap) **privately** to the maintainer before opening a public issue. A Code of Conduct based on the Contributor Covenant applies to all participants.

See `CONTRIBUTING.md`, `CODE_OF_CONDUCT.md` and the `README` in the repositories for the full details.
